

PRODUCT CATALOGUE

Business Software for every business

40 solutions from leading international vendors, in 3 categories

orthology.gr · sales@orthology.gr · +30 210 60 800 91

What's in this catalogue

1. Security & Awareness

15 solutions

- Network & Endpoint Security
- Data Security & Monitoring

2. Productivity & Device Management

21 solutions

- Email & Collaboration
- IT Monitoring & Management
- Remote Access & Virtualization
- Database Management
- Password Management & IT Support

3. Backup & Recovery

4 solutions

- Backup & Recovery

HOW TO USE THIS

How to read a product card

A short description of the customer benefit, in one sentence.

WHY IT STANDS OUT

the feature that sets it apart from the competition.

BEST FOR

Every product has one card

with the manufacturer's logo, a description oriented around the customer's benefit, its key differentiator, and a tag showing the customer profile it fits best.

Cards are grouped into 3 categories and subcategories, the same ones used in the company presentation, so the two documents work together.

1 / 3

Security & Awareness

15 solutions in 2 subcategories

Network & Endpoint Security (8)

Data Security & Monitoring (7)

Network & Endpoint Security

Firewall, VPN and application control in one unified system, with no need for a separate appliance per function.

Why it stands out: deployed in hours, with no weeks-long network redesign

SMB businesses

See your infrastructure the way an attacker would, before they get the chance to exploit it.

Why it stands out: regarded as the industry standard in vulnerability assessment

IT admins & security teams

Brings vulnerability findings from your entire network into one view, prioritised by real exploitability, not just CVE severity.

Why it stands out: focuses on real risk, not just the CVE score

Mid-size to enterprise

See the problem on your network before your users feel it, with real-time alerts.

Why it stands out: covers network, servers, cloud and IoT from one screen

Small to enterprise

Network & Endpoint Security

Phishing email never reaches the inbox — it's stopped across multiple filters before the user ever sees it.

Why it stands out: combines multiple antivirus engines at a single checkpoint

Phishing & ransomware

Spam stays out, your email stays online — cloud filtering that continuously checks every sender.

Why it stands out: keeps working even if your own mail server goes down

MSPs

Your weakest link becomes your first line of defence, with phishing simulations that train through practice.

Why it stands out: regarded as a global leader in security awareness training

ISO, GDPR compliance

Third-party application updates happen on their own, inside the Intune or SCCM you already use.

Why it stands out: no extra console to monitor

IT teams & MSPs

Data Security & Monitoring

Who opened this file, and when? The answer is already logged, across Active Directory and Microsoft 365.

Why it stands out: compliance proof is ready before anyone asks for it

GDPR, ISO compliance

Access rights that slipped past control come to light, before they become a point of exposure.

Why it stands out: focused exclusively on Microsoft 365, with no unnecessary features

Microsoft 365 governance

The permanent admin account disappears — rights are granted only for as long as the task takes.

Why it stands out: every use of admin rights is logged automatically

Least privilege & zero trust

The ransomware that gets past antivirus doesn't get past EDR — it watches behaviour, not just signatures.

Why it stands out: isolates the threat automatically, before it can spread

Advanced threats

Data Security & Monitoring

Before you buy yet another security tool, find out if the ones you already have are actually working.

Why it stands out: doesn't add a tool — it assesses the ones you're already paying for

Mature security teams

A team of experts watches your security alerts around the clock and takes on the response.

Why it stands out: takes on the response too, not just the alert

No security team

All your clients, one security view — without opening a separate tenant for each one.

Why it stands out: built specifically for MSPs with many clients

MSPs

2 / 3

Productivity & Device Management

21 solutions in 5 subcategories

Email & Collaboration (3)

IT Monitoring & Management (4)

Remote Access & Virtualization (6)

Database Management (4)

Password Management & IT Support (4)

Email & Collaboration

Your email never leaves your own network — a mail server on your own infrastructure, with full control.

Why it stands out: email data stays inside your own network

On-premise or hybrid

Email, calendars and contacts in one deployment, set up in hours instead of the days a typical Exchange server needs.

Why it stands out: deployment finishes in hours, not the days it typically takes

Small and medium businesses

Archives every email automatically and lets you search it in seconds, even after the user has deleted the message.

Why it stands out: directly eases compliance and e-discovery processes

SMB to enterprise

IT Monitoring & Management

One console monitors, updates and protects every endpoint in your infrastructure, however large your device fleet grows.

Benefit: less manual work, better infrastructure control

MSPs & IT departments

Three tools become one — monitoring, ticketing and remote support in a single per-technician subscription.

Why it stands out: per-technician pricing, not per endpoint

MSPs & IT teams

Network, hardware, helpdesk and security in one screen — a single glance tells you what's going on.

Why it stands out: fits IT teams that want one tool instead of four

SMB to mid-size IT

Scans the network for vulnerabilities and missing patches, and fixes them centrally — before someone outside finds them.

Why it stands out: combines vulnerability scanning with automatic patch deployment

Organised IT teams

Remote Access & Virtualization

Even on a slow connection, the session stays crisp — thanks to its own codec, DeskRT.

Why it stands out: also available on-premise, keeping connection data inside your own network

Every business size

Support, monitoring and automation in one console — not three different logins.

Why it stands out: a large ecosystem of integrations across ITSM, RMM and IoT

IT teams to enterprise

The password sticky note disappears — every connection and credential your team uses, in one encrypted place.

Why it stands out: connects through dozens of protocols (RDP, SSH, VNC, web) from one place

Mid-size to enterprise

Remote Access & Virtualization

No switching windows to fix the problem — the remote session opens straight from your own RMM.

Covers: per-technician pricing, not per endpoint

MSPs & IT teams

Your desktop fits in a browser tab — apps and desktops from anywhere, without the layers of a classic VDI setup.

Why it stands out: simpler and more cost-effective than traditional VDI solutions

Remote work

The Windows app you're missing runs right inside your Mac, with no reboot and no second device.

Why it stands out: no need for dual boot or a separate Windows PC

Mac users

Database Management

Your database gets the same commit history your code already has — every schema change runs through your CI/CD pipeline.

Supports: SQL Server, Oracle, PostgreSQL, MySQL

DevOps & CI/CD

Continuously tracks query performance and resource usage, so you catch the bottleneck before your users do in production.

Why it stands out: keeps months of history for comparison, not just a snapshot

Mission-critical databases

Developers work with realistic data, not a dump that's months old — lightweight database copies, with sensitive fields masked.

Why it stands out: created in minutes instead of hours

Development teams

Redgate SQL Toolbelt Essentials

A toolkit for SQL Server: source control, schema comparison and automation.

Covers: development, comparison, synchronisation, automation

IT & DevOps teams

Password Management & IT Support

Stores passwords with encryption and links them to each client's IT documentation, in one secure place.

Why it stands out: combines password management with IT infrastructure documentation

MSPs & IT teams

Devolutions Hub Business

A central password vault with access rights by team, so no one shares credentials over email or chat.

Why it stands out: integrates with Devolutions RDM: the connection opens directly

IT teams

No ticket ever gets lost in email — automatic triage and SLA tracking show you what's falling behind.

Why it stands out: up and running with no lengthy implementation

Small and medium businesses

Work done turns into an invoice automatically — tickets, hours and billing in one flow.

Why it stands out: built specifically for how an MSP operates

MSPs

3 / 3

Backup & Recovery

4 solutions in 1 subcategory

Backup & Recovery (4)

3. BACKUP & RECOVERY

Backup & Recovery

Backups for email, OneDrive, SharePoint and Teams outside Microsoft 365, so a deletion or attack never means permanent loss.

Why it stands out: works independently of Microsoft's native retention policies

Microsoft 365

One file or an entire VM — recovery happens at whichever level you actually need.

Why it stands out: completes in minutes, not hours, even for large VMs

Virtualized infrastructure

Step-by-step backup for Windows PCs and servers, from first install to first restore.

Why it stands out: set up with no need for specialist IT staff

Small businesses

Backup and disaster recovery for endpoints, servers and Microsoft 365, from a single cloud console.

Why it stands out: automatically verifies that every backup is actually recoverable
